FRENIC 5000P11S

FUJI INVERTERS

Now with dynamic torque vector control:
Optimum control for all situations.

c UL us LISTED

TÜV Rheinland BAUART GEPRÜFT TYPE APPROVED

CE

MEH 403e

Ideal combination of power and multiple-function. Dynamic torque-vector control promises optimum motor control under any operating conditions.

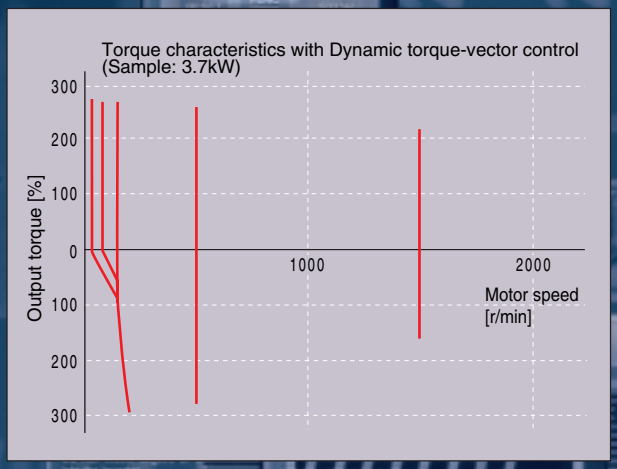
1. Dynamic torque-vector control

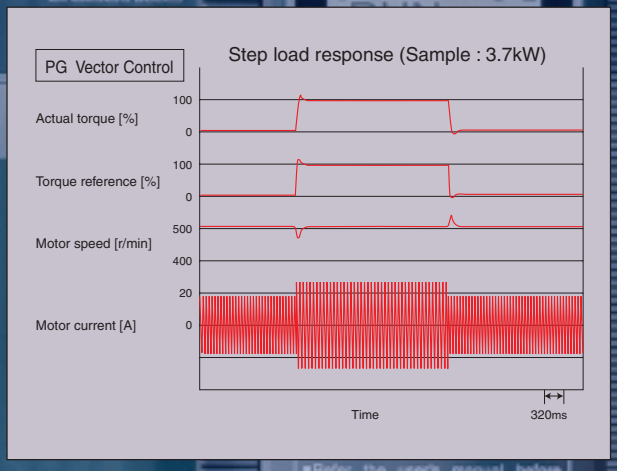
Powerful

Dynamic torque-vector control system performs high-speed calculation to determine the required motor power for the load status. Our key technology is optimal control of voltage and current vectors for maximum output torque.

- A high starting torque of 200% at 0.5Hz.*
  * 180% for 30kW or larger models.
- Achieves smooth acceleration/deceleration in the shortest time for the load condition.
- Using a high-speed CPU quickly responds to an abrupt load change, detects the regenerated power to control the deceleration time. This automatic decerelation function greatly reduces the inverter tripping.

- Feedback control with PG
  Enables the inverter to execute "vector control with PG" by adding an optional PG feedback card to obtain higher performance.
  - Speed control range : 1:1200
  - Speed control accuracy : ±0.02%
  - Speed control response : 40Hz

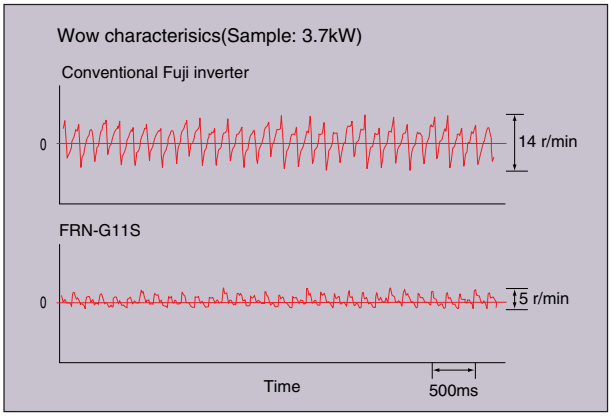


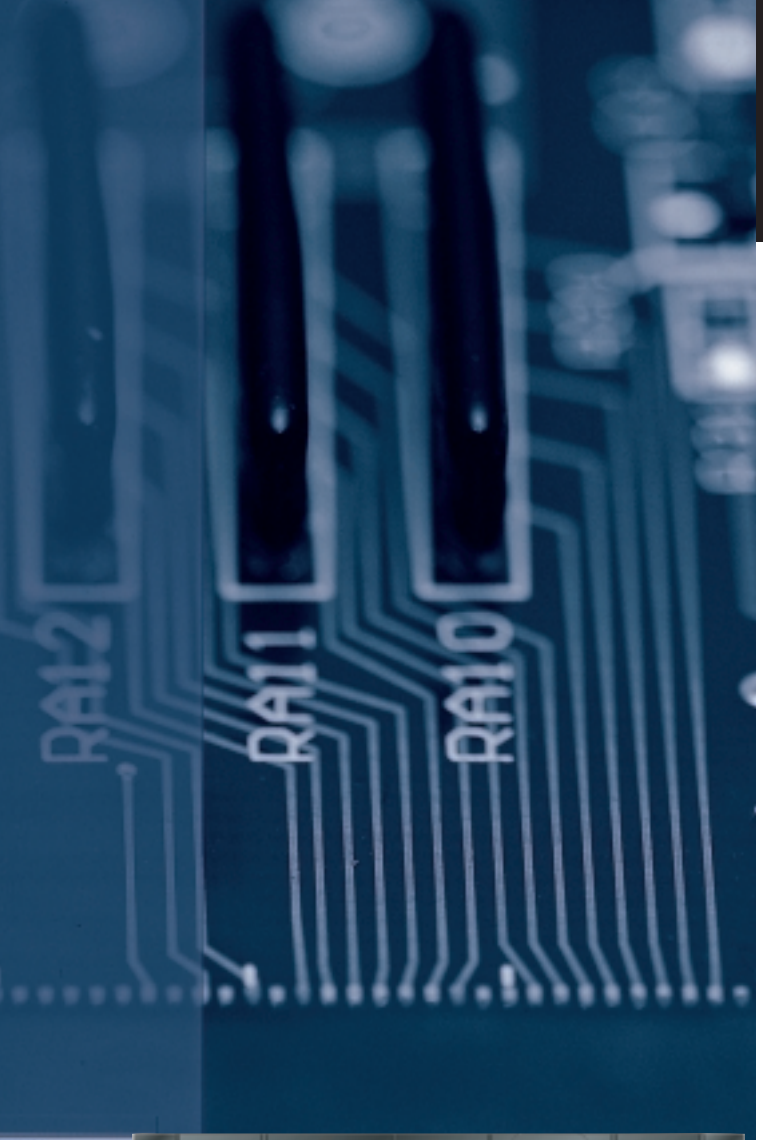


2. Reduced motor wow at low speed

Smooth

- Motor wow at low speed (1Hz) reduced to less than 1/2 of that achieved by conventional inverters, with the dynamic torque-vector control system, in combination with the Fuji's unique digital AVR.

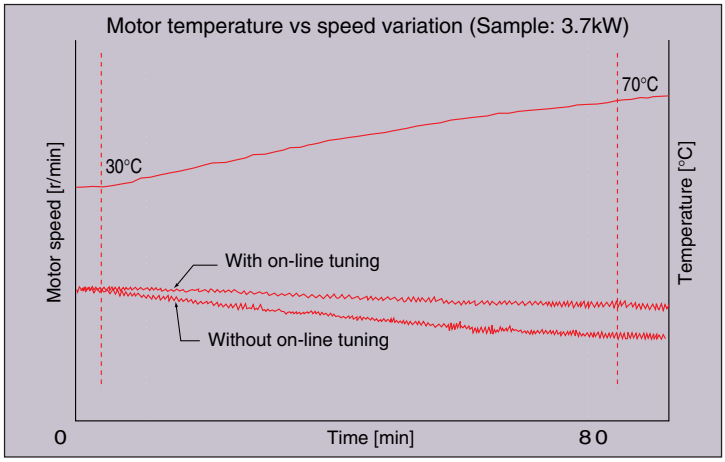




G11S/P11S

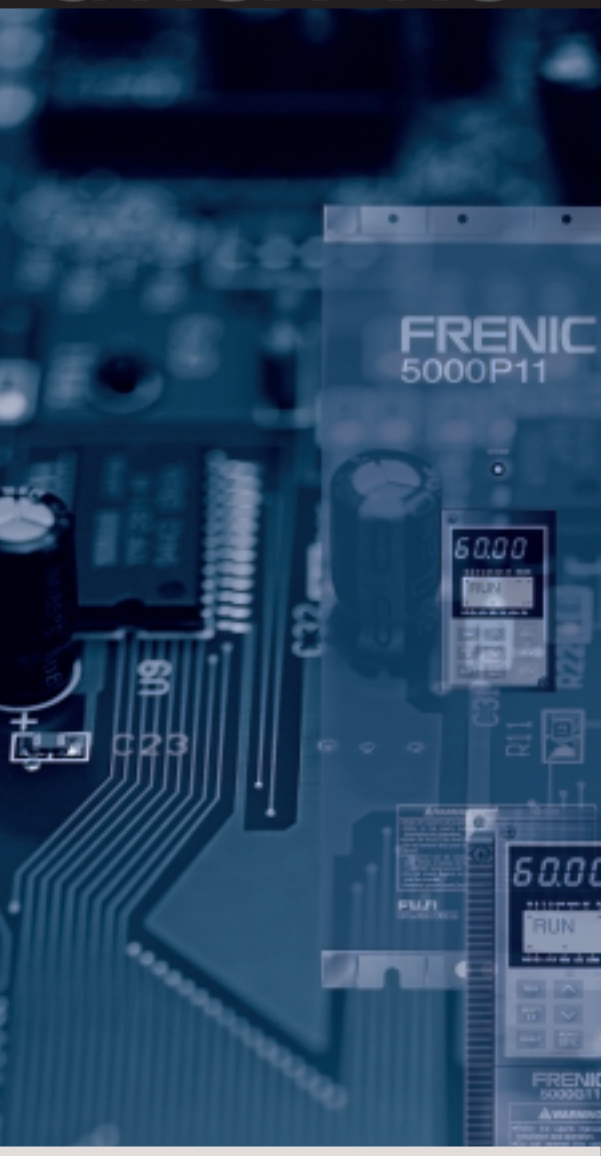
3. New on-line tuning system

- On-line tuning to continuously check for variation of motor characteristics during running for high-precision speed control.
- This tuning function also available for a second motor, which allows high-precision driving of the second motor by changeover operation between two motors.



4. Environment-friendly features

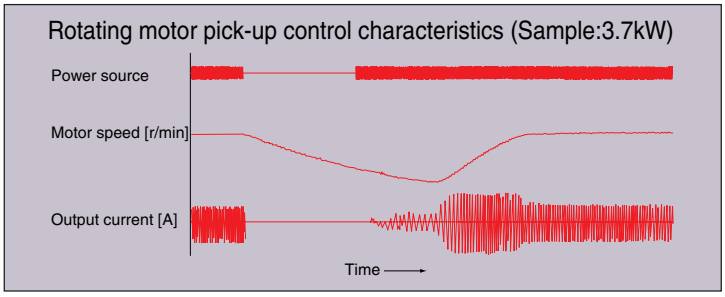
- Provided with low-noise control power supply systems which minimize noise interference on peripheral devices such as sensors.
- Equipped with terminals for connecting DC REACTOR that can suppress harmonics.
- Complied with EMC Directive (Emission) when connected to optional EMC-compliance filter.

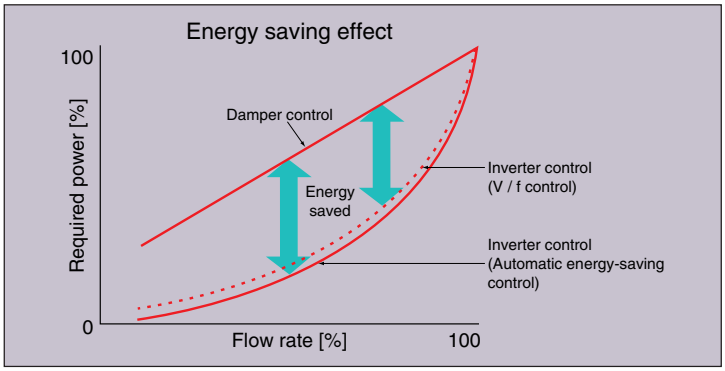


5. Advanced, convenient functions

Economical

- 16-step speed with timer control, rotating motor pick-up control for conveyance machinery
- Automatic energy-saving operation, PID control, cooling fan on/off control, line/inverter changeover operation for fans and pumps
- Rotating motor pick-up control:
  Restarts motor without any shocks, by detecting motor speed where motor is coasting after momentary power failure occurs.
- Automatic energy-saving operation function:
  Minimizes inverter and motor loss at light load.





6. Global products, communication

Global

- Conforms to major world safety standards: UL, cUL, TÜV (up to 22kW), EN (CE marking)
- Equipped with RS-485 interface as standard.
- Connection to field bus: PROFIBUS-DP, Interbus-S, DeviceNet, Modbus Plus (Option)
- Universal DI/DO : Monitors digital I/O signal status and transmits to a host controller, helping to simplify factory automation.

Safety Precautions

1. Use the contents of this catalog only for selecting product types and models. When using a product, read the Instruction Manual beforehand to use the product correctly.
2. Products introduced in this catalog have not been designed or manufactured for such applications in a system or equipment that will affect human bodies or lives. Customers, who want to use the products introduced in this catalog for special systems or devices such as for atomic-energy control, aerospace use, medical use, and traffic control, are requested to consult the Fuji's Sales Division. Customers are requested to prepare safety measures when they apply the products introduced in this catalog to such systems or facilities that will affect human lives or cause severe damage to property if the products become faulty.

7. Intelligent Keypad panel

- Copy function: Easily copies function codes and data to other inverters.
- Six languages (English, French, German, Italian, Spanish, and Japanese) are available as standard.
- Jogging (inching) operation from the Keypad or external signal
- Remote operation using optional extension cable (CBIII-10R-□□□)

8. Protective functions, Maintenance

Protection

- Motors with various characteristics can be used by setting thermal time constant for the electronic thermal overload protection.
- Input phase loss protective function protects the inverter from damage caused by disconnection of power supply lines.
- Motor is protected with a PTC thermistor.
- Input terminals for auxiliary control power supply (1.5kW or larger models) : Alarm signal output will be held even if main circuit power supply has shut down.

Excellent maintainability

The items below can be monitored on the Keypad panel and making it easy to analyze the cause of trip and to take preventive measures.

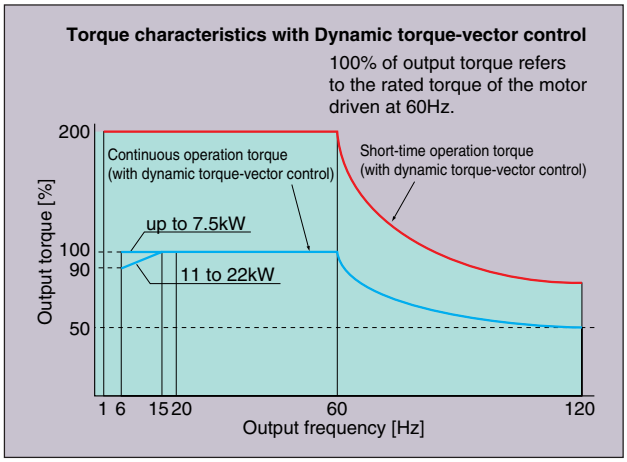
- Input/output terminals check
- Life expectancy of main-circuit capacitors
- Inverter on-load factor
- Accumlated operation time
- Inverter operating condition (output current, heat sink temperature, input power, etc.)
- Detailed data on trip cause

9. Extensive product line

- Two series are available: G11S series ranging from 0.2 to 630kW for general industrial machines and P11S series ranging from 5.5 to 710kW for fans and pumps.
- Totally-enclosed casing (IP40) (up to 22kW as standard).
- Optional IP20 enclosure available for 30kW or larger models.
- Water-proof models(IP65 for 7.5kW or smaller, IP54 for 11 to 22kW) as a separate series (available soon).

10. Other useful functions

- Side-by-side mounting (up to 22kW) saves space when inverters are installed in a panel.
- The uniform height (260mm) of products (up to 7.5kW) makes it easy to design panels.
- User-definable control terminals: Digital input (9 points), transistor output (4points), and relay contact output (1point).
- Active drive feature: Performs prolonged acceleration at reduced torque, monitoring the load status to prevent tripping.
- Stall prevention function is provided as standard. Active or inactive can be also selected.



* The above graph shows an example of torque characteristics when combining FRENIC5000G11S (up to 22kW at dynamic torque-vector control) with Fuji standard three-phase motor (8-type series, 4 poles). Continuous operation torque is for limits of allowable load torque for using the motor within the allowable temperature range and is not for motor output torque.
The motor output torque is shown by the short-time operation torque.

Variation

Easy to apply to customer systems. A consistent design concept in all models from 0.2kW to 710kW.

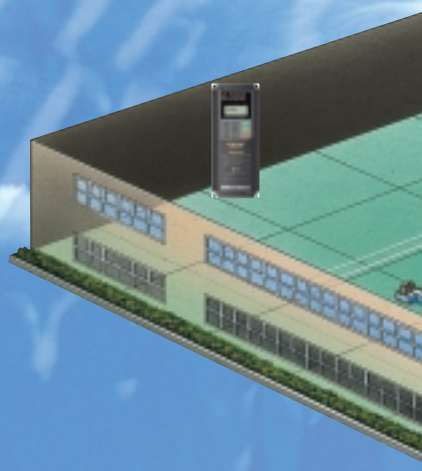
FRENIC 5000G1
all industrial pla

Fans

- Air-conditioning system (for factory, building, office, hospital, clean room, shop, and cattle barn)
- Dryer
- Boiler fan
- Fans for controlling furnace temperature
- Roof fans controlled as a group
- Refrigerator
- Compressor
- Built-in blower in a film-manufacturing machine
- Cooling-tower fans
- Ventilating fans
- Air-conditioning equipment



Food processing machines

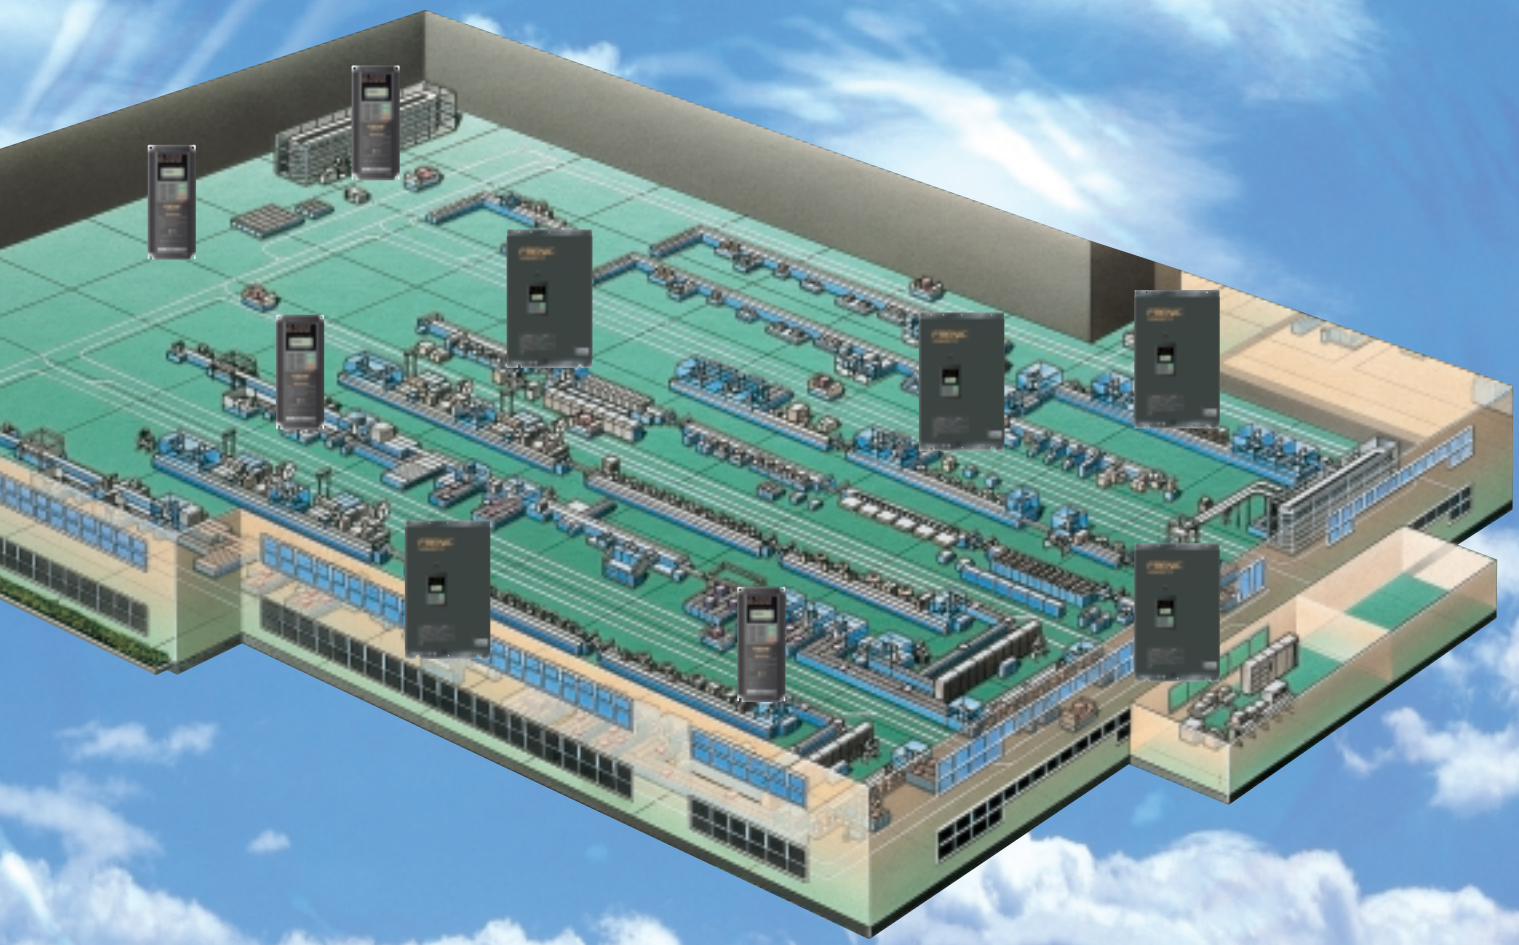
- Food mixing machine
- Food slicer
- Grain milling machine (bread, cake, noodles)
- Tea making machine
- Rice cleaning machine

1S/P11S can be used for almost
ant and equipment areas.

Machine tools
- Grinding machine
- Sanding machine
- Milling machine
- Lathe
- Drilling machine
- Turntable
- Work positioning machine
- PC board drilling machine
- Winding machine
- Press

Conveyance machinery
- Crane (traveling, traversing, hoisting)
- Automated warehouse
- Conveyor (belt, chain, screw, roller)
- Lift
- Car parking facility
- Elevator, escalator
- Automatic door
- Shutter equipment
- Speed-change gear

Chemical machinery/wood working machines
- Fluid mixing machine
- Extruder
- Vibrator
- Centrifugal separator
- Coating machine
- Take-up roller
- Routing machine
- Sanding machine
- Planing machine



Electric pumps
- Tankless water supply system
- Submersible motor pump
- Vacuum pump
- Fountain pump
- Cooling water pump
- Circulating hot water pump
- Well pump
- Agricultural storage pump
- Water treatment system
- Constant-flow pump
- Sludge pump

Packaging machinery
- Individual packaging/inner-packaging machine
- Packing machine
- Outer-packaging machine

Paper making/ textile machinery
- Spinning machine
- Knitting machine
- Textile printing machine
- Industrial sewing machine
- Synthetic fiber manufacturing plant

Other machinery
- Automated feed/medicine mixer
- Commercial-use washing machine
- Offset printing press
- Book-binding machine
- Car-washing machine
- Shredder
- Dishwasher
- Test equipment
- Crusher

NOTES:
*1) Inverter output capacity (kVA) at 440V in 400V series, 220V in 200V series. *2) Output voltage is proportional to the power supply voltage and cannot exceed the power supply voltage. *3) Current derating may be required in case of low impedance loads such as high frequency motor. *4) When the input voltage is 380V/50Hz or 380 to 415V/60Hz, the tap of the auxiliary transformer must be changed. *5) Order individually. *6) Refer to the IEC 61800-3(5.2.3). *7) Tested at standard load condition (85% load). *8) This value is under FUJI original calculation method. (Refer to the Technical Information.) *9) When power-factor correcting DC reactor is used. *10) With a nominal applied motor, this value is average torque when the motor decelerates and stops from 60Hz. (It may change according to motor loss.)

NOTES:
*1) Inverter output capacity (kVA) at 440V in 400V series, 220V in 200V series. *2) Output voltage is proportional to the power supply voltage and cannot exceed the power supply voltage. *3) Current derating may be required in case of low impedance loads such as high frequency motor. *4) When the input voltage is 380V/50Hz or 380 to 415V/60Hz, the tap of the auxiliary transformer must be changed. *5) Order individually. *6) Refer to the IEC 61800-3(5.2.3). *7) Tested at standard load condition (85% load). *8) This value is under FUJI original calculation method. (Refer to the Technical Information.) *9) When power-factor correcting DC reactor (DCR) is used. *10) With a nominal applied motor, this value is average torque when the motor decelerates and stops from 60Hz. (It may change according to motor loss.)

Common Specifications

Item			Explanation	
			G11S	P11S
Output frequency	Setting	Maximum frequency	50 to 400Hz	50 to 120Hz
		Base frequency	25 to 400Hz	25 to 120Hz
		Starting frequency	0.1 to 60Hz, Holding time: 0.0 to 10.0s	
		Carrier frequency *1)	0.75 to 15kHz (55kW or smaller) 0.75 to 10kHz (75kW or larger)	0.75 to 15kHz (22kW or smaller) 0.75 to 10kHz (30 to 75kW) 0.75 to 6kHz (90kW or larger)
	Accuracy (Stability)		• Analog setting : ±0.2% of Maximum frequency (at 25±10°C) • Digital setting : ±0.01% of Maximum frequency (at –10 to +50°C)	
	Setting resolution		• Analog setting : • 1/1000 of Maximum frequency ex.) 0.06Hz at 60Hz, 0.12Hz at 120Hz, (0.4Hz at 400Hz: G11S) • 1/3000 for 30kW and above • Digital setting : 0.01Hz at Maximum frequency of up to 99.99Hz (0.1Hz at Maximum frequency of 100Hz and above) • LINK setting : • 1/20000 of Maximum frequency ex.) 0.003Hz at 60Hz, 0.006Hz at 120Hz, (0.02Hz at 400Hz: G11S) • 0.01Hz (Fixed)	
Control	Control method		• V/f control (Sinusoidal PWM control) • Dynamic torque-vector control (Sinusoidal PWM control) • Vector control with PG (*) (G11S only)	
	Voltage / freq. (V/f) characteristic		Adjustable at base and maximum frequency, with AVR control : 320 to 480V (400V series), 80 to 240V (200V series)	
	Torque boost		Selectable by load characteristics: Constant torque load (Auto/manual), Variable torque load (Manual)	
	Operation method		• KEYPAD operation : [Prog] or [Run] key, [Stop] key	
			• Digital input signal operation : FWD or REV command, Coast-to-stop command, etc.	
			• LINK operation : RS-485 (Standard) T-Link (FUJI private link), PROFIBUS-DP, Interbus-S, DeviceNet, Modbus Plus, JPCN1 (Option)	
	Frequency setting (Frequency command)		• KEYPAD operation: [▲] or [▼] key	
			• External potentiometer (*) : 1 to 5kΩ (1/2W)	
			• Analog input : 0 to +10V DC (0 to +5V DC), 4 to 20mA DC (Reversible) 0 to ±10V DC (0 to ± 5V DC) ....Reversible operation by polarized signal can be selected. (Inverse) +10 to 0V DC, 20 to 4mA DC.....Inverse mode operation can be selected.	
			• UP/DOWN control : Output frequency increases when UP signal is ON, and decreases when DOWN signal is ON.	
			• Multistep frequency : Up to 16 different frequencies can be selected by digital input signal.	
			• Pulse train input (*) : 0 to 100kp/s	
			• Digital signal (parallel) (*) : 16-bit binary	
			• LINK operation : RS485 (Standard) T-Link (FUJI private link), RPOFIBUS-DP, Interbus-S, DeviceNet, Modbus Plus, JPCN1 (Option)	
			• Programmed PATTERN operation: Max. 7 stages	
	Jogging operation		[Prog] or [Run] key, FWD or REV digital input signal	
	Running status signal		Transistor output (4 points) : RUN, FAR, FDT, OL, LU, TL, etc.	
			Relay output (2 points) : • Same as transistor output • Alarm output (for any fault)	
			Analog output (1 point) : Output frequency, Output current, Output torque, etc.	
			Pulse output (1 point) : Output frequency, Output current, Output torque, etc.	
	Acceleration / Deceleration time		0.01 to 3600s : • Independently adjustable acceleration and deceleration • 4 different times are selectable.	
			Mode select : Linear, S-curve (weak), S-curve (strong), Non-linear	
	Active drive		When the acceleration time reaches 60s, the motor output torque is automatically reduced to rated torque. Then the motor operation mode is changed to torque limiting operation. The acceleration time is automatically extended up to 3 times.	
	Frequency limiter		High and Low limiter can be preset.	
	Bias frequency		Bias frequency can be preset.	
	Gain for frequency setting		Gain for frequency setting can be preset. (0.0 to 200.0%) ex.) Analog input 0 to +5V DC with 200% gain results in maximum frequency at 5V DC.	
	Jump frequency control		Jump frequency (3 points) and its common jump hysteresis width (0 to 30Hz) can be preset.	
	Rotating motor pick up (Flying start)		A rotating motor (including inverse rotating mode) can be smoothly picked up without stopping the motor (speed search method).	
	Auto-restart after momentary power failure		Automatic restart is available without stopping motor after a momentary power failure (speed search method). When "Smooth recovery" mode is selected, the motor speed drop is held minimum. (The inverter searches the motor speed, and smoothly returns to setting frequency. Even if the motor circuit is temporarily opened, the inverter operates without a hitch.)	
	Line / Inverter changeover operation		Controls the switching operation between line power and inverter. The inverter has sequence function inside.	
	Slip compensation		The inverter output frequency is controlled according to the load torque to keep motor speed constant. When the value is set at "0.00" and "Torque-vector" is set at "active", the compensation value automatically selects the Fuji standard motor.	
			Slip compensation can be preset for the second motor.	
	Droop operation		The motor speed droops in proportion to output torque (–9.9 to 0.0Hz).....G11S only.	
	Torque limiting		• When the motor torque reaches a preset limiting level, this function automatically adjusts the output frequency to prevent the inverter from tripping due to an overcurrent. • Torque limiting 1 and 2 can be individually set, and are selectable with a digital input signal.	
	Torque control		Output torque (or load factor) can be controlled with an analog input signal.....G11S only.	
	PID control		This function can control flowrate, pressure, etc. (with an analog feedback signal.) • **Reference signal** • KEYPAD operation ([▲] or [▼] key) : Setting freq. / Max. freq. X 100 (%) • PATTERN operation : Setting freq./Max. freq. X 100 (%) • Voltage input (Terminal 12) : 0 to +10V DC • DI option input (*) : • BCD, setting freq./Max. freq. X 100 (%) • Current input (Terminal C1) : 4 to 20mA DC • Binary, full scale/100 (%) • Reversible operation with polarity (Terminal 12) : 0 to ±10V DC • Multistep frequency setting : Setting freq./Max. freq. X 100 (%) • Reversible operation with polarity (Terminal 12 + V1) : 0 to ±10V DC • RS-485 : Setting freq./Max. freq. X 100 (%) • Inverse mode operation (Terminal 12) : +10 to 0V DC • Inverse mode operation (Terminal C1) : 20 to 4mA DC • **Feedback signal** • Terminal 12 (0 to +10V DC or +10 to 0V DC) • Terminal C1 (4 to 20mA DC or 20 to 4mA DC)	
	Automatic deceleration		Torque limiter 1 (Braking) is set at "F41: 0" (Same as Torque limiter 2 (Braking)). • In deceleration : The deceleration time is automatically extended up to 3 times the setting time for tripless operation even if braking resistor not used. • In constant speed operation : Based on regenerative energy, the frequency is increased and tripless operation is active.	
	Second motor's setting		This function is used for two motors switching operation. • The second motor's V/f characteristics (base and maximum frequency) can be preset. • The second motor's circuit parameter can be preset. Torque-vector control can be applied to both motors.	
	Energy saving operation		This function minimizes inverter and motor losses at light load.	
	Fan stop operation		This function is used for silent operation or extending the fan's lifetime.	
	Universal DI		Transmits to main controller of LINK operation.	
	Universal DO		Outputs command signal from main controller of LINK operation.	
	Universal AO		Outputs analog signal from main controller of LINK operation.	
	Zero speed control (*)		The stopped motor holds its rotor angle.....G11S only.	
	Positioning control (*)		The SY option card can be used for positioning control by differential counter method.	
	Synchronized operation (*)		This function controls the synchronize operation between 2 axes with PGs.	

Note: (*) Option
*1) Inverter may automatically reduce carrier frequency, in accordance with ambient temperature or output current for protecting inverter.

Item		Explanation	
Indication	Operation mode (Running)	LED monitor	LCD monitor (Japanese, English, German, French, Spanish, Italian)
		• Output frequency 1 (Before slip compensation) (Hz) • Output frequency 2 (After slip compensation) (Hz) • Setting frequency (Hz) • Output current (A) • Output voltage (V) • Motor synchronous speed (r/min) • Line speed (m/min) • Load shaft speed (r/min) • Torque calculation value (%) • Input power (kW) • PID reference value • PID reference value (remote) • PID feedback value • Trip history :Cause of trip by code (Even when main power supply is off, trip history data of the last 4 trips are retained.)	Operation monitor & Alarm monitor **Operation monitor** • Displays operation guidance • Bargraph: Output frequency (%), Output current (A), Output torque (%) **Alarm monitor** • The alarm data is displayed when the inverter trips. Function setting & monitor **Function setting** Displays function codes and its data or data code, and changes the data value.
	Stopping	Selected setting value or output value	**Operation condition** • Output frequency (Hz) • Output current (A) • Output voltage (V) • Torque calculation value (%) • Setting frequency (Hz) • Operation condition (FWD / REV, IL, VL / LU, TL) • Motor synchronous speed (r/min) • Load shaft speed (r/min) • Line speed (m/min) • PID reference value • PID feedback value • Driving torque limiter setting vaiue (%) • Braking togue limiter setting value (%) **Tester function (I/O check)** • Digital I/O : ■ (ON), □ (OFF) • Analog I/O: (V), (mA), (H), (p/s) **Maintenance data** • Operation time (h) • DC link circuit voltage (V) • Temperature at inside air (°C) • Temperature at heat sink (°C) • Maximum current (A) • Main circuit capacitor life(%) • Control PC board life (h) • Cooling fan operation time (h) • Communication error times (KEYPAD,RS485, Option) • ROM version (Inverter, KEYPAD, Option) **Load factor calculation** • Measurement time (s) • Maximum current (A) • Average current (A) • Average braking power (%) **Alarm data** • Output frequency (Hz) • Output current (A) • Output voltage (V) • Torque calculation value (%) • Setting frequency (Hz) • Operation condition (FWD / REV, IL, VL / LU, TL) • Operation time (h) • DC link circuit voltage (V) • Temperature at inside air (°C) • Hest sink temperature (°C) • Communication error times (KEYPAD,RS-485, Option) • Digital input terminal condition (Remote, Communication) • Transistor output terminal condition • Trip history code • Multiple alram exist
	Trip mode	Displays the cause of trip by codes as follows. • OC1 (Overcurrent during acceleration) • OC2 (Overcurrent during deceleration) • OC3 (Overcurrent during running at constant speed) • EF (Ground fault) • Lin (Input phase loss) • FUS (Fuse blown) • OU1 (Overvoltage during acceleration) • OU2 (Overvoltage during deceleration) • OU3 (Overvoltage running at constant speed) • LU (Undervoltage) • OH1 (Overheating at heat sink) • OH2 (External thermal relay tripped) • OH3 (Overtemperature at inside air) • dBH (Overheating at DB circuit) • OL1 (Motor 1 overload) • OL2 (Motor 2 overload) • OLU (Inverter unit overload) • OS (Overspeed) • PG (PG error) • Er1 (Memory error) • Er2 (KEYPAD panel communication error) • Er3 (CPU error) • Er4 (Option error) • Er5 (Option error) • Er6 (Operation procedure error) • Er7 (Output phase loss error, impedance imbalance) • Er7. (Charging circuit alarm, 30kW or larger) • Er8 (RS-485 error)	
	Charge lamp	When the DC link circuit voltage is higher than 50V, the charge lamp is ON.	
Protection	Overload	Protects the inverter by electronic thermal overload function and by detection of inverter temperature.	
	Overvoltage	Detects DC link circuit overvoltage,and stops the inverter. (400V series: 800V DC, 200V series: 400V DC)	
	Undervoltage	Detects DC link circuit undervoltage,and stops the inverter. (400V series: 400V DC, 200V series: 200V DC)	
	Input phase loss	Phase loss protection for power line input.	
	Overheating	Protects the inverter by detection of inverter temperature.	
	Short-circuit	Short-circuit protection for inverter output circuit	
	Ground fault	• Ground fault protection for inverter output circuit (3-phase current detection method) • Zero-phase current detection method (30kW or larger)	
	Motor overload	• The inverter trips,and then protects the motor. • Electronic thermal overload protection can be set for standard motor or inverter motor • Thermal time constant (0.5 to 75.0 minutes) can be preset for a special motor. • The second motor's electronic thermal overload protection can be preset for 2-motor changeover operation.	
	DB resistor overheating	• Prevents DB resistor overheating by internal electronic thermal overload relay (7.5kW or smaller). • Prevents DB resistor overheating by external thermal overload relay attached to DB resistor (11kW or larger). (The inverter stops electricity discharge operation to protect the DB resistor.)	
	Stall prevention	• Controls the output frequency to prevent OC (overcurrent) trip when the output current exceeds the limit value during acceleration. • Lowers the output frequency to hold almost constant torque when the output current exceeds the limit value during operation at constant speed. • Controls the output frequency to prevent OU (overvoltage) trip when the DC link circuit voltage exceeds the limit value during deceleration.	
	Output phase loss	When the inverter executes auto-tuning, detects each phase impedance imbalance.	
	Motor protection by PTC thermistor	When the motor temperature exceeds allowable value, the inverter trips automatically.	
	Auto reset	When the inverter is tripped, it resets automatically and restarts.	
Condition (Installation and operation)	Installation location*	Free from corrosive gases, flammable gases, oil mist, dusts, and direct sunlight. Indoor use only.	* If the inverter has to be used in an atmosphere including the hydrogen sulfide gases, a special model might be available. Contact Fuji Electric FA.
	Altitude	1000m or less. Applicable to 3000m with power derating (-10%/1000m)	
	Ambient temperature	–10 to +50 °C. For inverters of 22kW or smaller, remove the ventilation covers when operating it at a temperature of 40 °C or above.	
	Ambient humidity	5 to 95%RH (non-condensing)	
	Vibration	3mm at from 2 to less than 9Hz, 9.8m/s^2 at from 9 to less than 20Hz, 2m/s^2 at from 20 to less than 55Hz (2m/s^2 at from 9 to less than 55Hz :G11S 90kW, P11S 110kW or more) 1m/s^2 at from 55 to less than 200Hz,	
Storage condition		-Temperature : –25 to +65 °C, -Humidity : 5 to 95%RH (non-condensing)	

Terminal Functions

	Symbol	Terminal name	Function	Remarks
Main circuit	L1/R, L2/S, L3/T	Power input	Connect a 3-phase power supply.	
	U, V, W	Inverter output	Connect a 3-phase induction motor.	
	P1, P(+)	For DC REACTOR	Connect the DC REACTOR for power-factor correcting or harmonic current reducing.	DC REACTOR: 55kW or smaller : Option 75kW or larger : Standard
	P(+), N(-)	For BRAKING UNIT	• Connect the BRAKING UNIT (Option). • Used for DC bus connection system.	BRAKING UNIT (Option): G11S: 11kW or larger, P11S: 15kW or larger
	P(+), DB	For EXTERNAL BRAKING RESISTOR	Connect the EXTERNAL BRAKING RESISTOR (Option)	G11S : 7.5kW or smaller, P11S : 11kW or smaller
	⏚ G	Grounding	Ground terminal for inverter chassis (housing).	
	R0, T0	Auxiliary control power supply	Connect the same AC power supply as that of the main circuit to back up the control circuit power supply.	0.75kW or smaller: Not correspond
Analong input	13	Potentiometer power supply	+10V DC power supply for frequency setting POT (POT: 1 to 5kΩ)	• Allowable maximum output current : 10mA
	12	Voltage input	• 0 to +10V DC/0 to 100% (0 to +5V DC/0 to 100%) • Reversible operation can be selected by function setting. 0 to ±10V DC /0 to ±100% (0 to ±5V DC/0 to ±100%) • Inverse mode operation can be selected by function setting or digital input signal. +10 to 0V DC/0 to 100%	• Input impedance: 22kΩ • Allowable maximum input voltage: ±15V DC • If input voltage is 10 to 15V DC, the inverter estimates it to10V DC.
		(Torque control)	Used for torque control reference signal.	
		(PID control)	Used for PID control reference signal or feedback signal.	
		(PG feedback)	Used for reference signal of PG feedback control (option)	
	C1	Current input	• 4 to 20mA DC/0 to 100% • Inverse mode operation can be selected by function setting or digital input signal. 20 to 4mA DC/0 to 100%	• Input impedance:250kΩ • Allowable maximum input current: 30mA DC • If input current is 20 to 30mA DC , the inverter estimates it to20mA DC.
		(PID control)	Used for PID control reference signal or feedback signal.	
	11	Common	Common for analog signal	Isolated from terminals CME and CM.
Digital input	FWD	Forward operation command	FWD - CM: ON ..... The motor runs in the forward direction. FWD - CM: OFF ..... The motor decelerates and stops.	When FWD and REV are simultaneously ON,the motor decelerates and stops.
	REV	Reverse operation command	REV - CM: ON ..... The motor runs in the reverse direction. REV - CM: OFF ..... The motor decelerates and stops.	
	X1 X2 X3 X4 X5 X6 X7 X8 X9	Digital input 1 Digital input 2 Digital input 3 Digital input 4 Digital input 5 Digital input 6 Digital input 7 Digital input 8 Digital input 9	These terminals can be preset as follows.	• ON state maximum input voltage: 2V (maximum source current : 5mA) • OFF state maximum terminal voltage: 22 to 27V (allowable maximum leakage current: 0.5mA)
	(SS1) (SS2) (SS4) (SS8)	Multistep freq. selection	(SS1) : 2 (0, 1) different frequencies are selectable. (SS1,SS2) : 4 (0 to 3) different frequencies are selectable. (SS1,SS2,SS4) : 8 (0 to 7) different frequencies are selectable. (SS1,SS2,SS4,SS8) : 16 (0 to 15) different frequencies are selectable.	Frequency 0 is set by F01 (or C30). (All signals of SS1 to SS8 are OFF)
	(RT1) (RT2)	ACC / DEC time selection	(RT1) : 2 (0, 1) different ACC / DEC times are selectable. (RT1,RT2) : 4 (0 to 3) different ACC / DEC times are selectable.	Time 0 is set by F07/F08. (All signals of RT1 to RT2 are OFF)
	(HLD)	3-wire operation stop command	Used for 3-wire operation. (HLD) - CM: ON ..... The inverter self-holds FWD or REV signal. (HLD) - CM: OFF ..... The inverter releases self-holding.	Assigned to terminal X7 at factory setting.
	(BX)	Coast-to-stop command	(BX) - CM: ON ..... Motor will coast-to-stop. (No alarm signal will be output.)	• The motor restarts from 0Hz by turning off BX with the operation command (FWD or REV) ON. • Assigned to terminal X8 at factory setting.
	(RST)	Alarm reset	(RST) - CM: ON ..... Faults are reset. (This signal should be held for more than 0.1s.)	• During normal operating, this signal is ignored. • Assigned to X9 at factory setting.
	(THR)	Trip command (External fault)	(THR) - CM: OFF ..... "OH2 trip" occurs and motor will coast-to-stop.	This alarm signal is held internally.
	(JOG)	Jogging operation	(JOG) - CM: ON ..... JOG frequency is effective.	This signal is effective only while the inverter is stopping.
	(Hz2/Hz1)	Freq. set 2 / Freq. set 1	(Hz2/Hz1) - CM: ON ..... Freq. set 2 is effective.	If this signal is changed while the inverter is running, the signal is effective only after the inverter stops.
	(M2/M1)	Motor 2 / Motor 1	(M2/M1) - CM: ON ..... The motor circuit parameter and V/f characteristics are changed to the second motor's ones.	If this signal is changed while the inverter is running, the signal is effective only after the inverter stops.
	(DCBRK)	DC brake command	(DCBRK) - CM: ON ..... The DC injection brake is effective. (In the inverter deceleration mode)	If the operation command(FWD/REV) is input while DC braking is effective, the operation command (FWD/REV) has priority.
	(TL2/TL1)	Torque limiter 2 / Torque limiter 1	(TL2/TL1) - CM: ON ..... Torque limiter 2 is effective.	
	(SW50) (SW60)	Switching operation between line and inverter	(SW50(SW60)) - CM: ON .....The motor is changed from inverter operation to line operation. (SW50(SW60)) - CM: OFF ..... The motor is changed from line operation to inverter operation.	Main circuit changeover signals are output through Y1 to Y5 terinal.
	(UP)	UP command	(UP) - CM: ON ..... The output frequency increases.	When UP and DOWN commands are simultaneously ON,DOWN signal is effective.
	(DOWN)	DOWN command	(DOWN) - CM: ON ..... The output frequency decreases. • The output frequency change rate is determined by ACC / DEC time. • Restarting frequency can be selected from 0Hz or setting value at the time of stop.	
	(WE-KP)	Write enable for KEYPAD	(WE-KP) - CM: ON ..... The data is changed by KEYPAD.	
	(Hz/PID)	PID control cancel	(Hz/PID) - CM: ON ..... The PID control is canceled,and frequency setting by KEYPAD (■ or ■)is effective.	
	(IVS)	Inverse mode changeover	(IVS) - CM: ON ..... Inverse mode is effective in analog signal input.	If this signal is changed while the inverter is running, the signal is effective only after the inverter stops.
	(IL)	Interlock signal for 52-2	Connect to auxiliary contact (1NC) of 52-2.	
	(Hz/TRQ)	TRQ control cancel	(Hz/TRQ) - CM: ON ..... The torque control is canceled, and ordinary operation is effective.	
	(LE)	Link enable (RS-485, Bus)	(LE) - CM: ON ..... The link opereation is effective. Used to switch operation between ordinary operation and link operation to communication.	RS-485: Standard, Bus: Option
	(U-DI)	Universal DI	This signal is transmitted to main controller of LINK operation.	
	(STM)	Pick up start mode	(STM) - CM: ON ..... The "Pick up" start mode is effective.	
	(PG/Hz)	SY-PG enabled	(PG/Hz) - CM: ON ..... Synchronized operation or PG-feedback operation is effective.	Option
	(SYC)	Syuhronization command	(SYC) - CM: ON ..... The motor is controlled for synchronized operation between 2 axes with PGs.	Option
	(ZERO)	Zero speed command	(ZERO) - CM: ON ..... The motor decelerates and holds its rotor angle.	This function can be selected at PG feedback control. Option
	(STOP1)	Forced stop command	(STOP1) - CM: ON ..... The motor decelerates and stops.	
	(STOP2)	Forced stop command with Deceleration time4	(STOP2) - CM: ON ..... The motor decelerates and stops with Deceleration time4.	
	(EXITE)	Pre-exciting command:	(EXITE) - CM: ON ..... The magnetic flux can be established preliminary before starting at PG vector mode.	
	PLC	PLC terminal	Connect PLC power supply to avoid malfunction of the inveter that has SINK type digital input,when PLC power supply is off.	
	CM	Common	Common for digital signal	Isolated from terminals CME and 11.

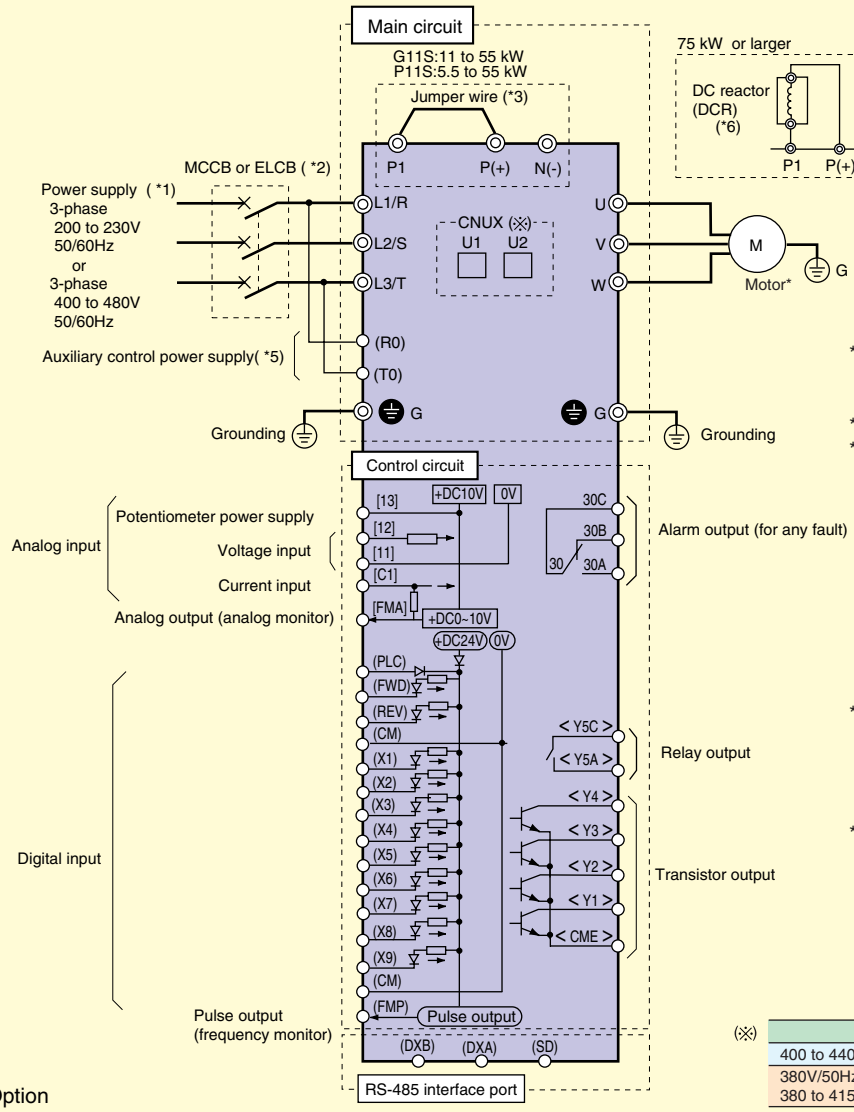
Terminal Functions

	Symbol	Terminal name	Function	Remarks
Analog output	FMA	Analog monitor	Output voltage (0 to 10V DC) is proportional to selected function's value as follows. The proportional coefficient and bias value can be preset. • Output frequency 1 (Before slip compensation) (0 to max. frequency) • Output frequency 2 (After slip compensation) (0 to max. frequency) • Output current (0 to 200%) • Output voltage (0 to 200%) • Output torque (0 to 200%) • Load factor (0 to 200%) • Input power (0 to 200%) • PID feedback value (0 to 100%) • PG feedback value (0 to max. speed) • DC link circuit voltage (400V series : 0 to 1000V) (200V series : 0 to 500V)	Allowable maximum output current: 2mA
	(11)	(Common)	• Universal AO (0 to 100%)	
Pulse output	FMP	Pulse rate monitor	• Pulse rate mode : Pulse rate is proportional to selected function's value* (50% duty pulse) • Average voltage mode : Average voltage is proportional to selected function's value* (2670P/S pulse width control)	Allowable maximum output current : 2mA
	(CM)	(Common)	* Kinds of function to be output is same as those of analog output (FMA).	
Transistor output	Y1	Transistor output 1	Output the selected signals from the following items.	• ON state maximum output voltage : 2V (Allowable maximum sink current : 50mA) • OFF state maximum leakage current : 0.1mA (Allowable maximum voltage : 27V)
	Y2	Transistor output 2		
	Y3	Transistor output 3		
	Y4	Transistor output 4		
	(RUN)	Inverter running	Outputs ON signal when the output frequency is higher than starting frequency.	
	(FAR)	Frequency equivalence signal	Outputs ON signal when the difference between output frequency and setting frequency is smaller than FAR hysteresis width.	
	(FDT1)	Frequency level detection	Outputs ON signal by comparison of output frequency and preset value (level and hysteresis).	
	(LU)	Undervoltage detection signal	Outputs ON signal when the inverter stops by undervoltage while the operation command is ON.	
	(B/D)	Torque polarity	Outputs ON signal in braking or stopping mode, and OFF signal in driving mode.	
	(TL)	Torque limiting	Outputs ON signal when the inverter is in torque-limiting mode.	
	(IPF)	Auto-restarting	Outputs ON signal during auto restart operation mode.(including "restart time")	
	(OL1)	Overload early warning	• Outputs ON signal when the electronic thermal value is higher than preset alarm level. • Outputs ON signal when the output current value is higher than preset alarm level.	
	(KP)	KEYPAD operation mode	Outputs ON signal when the inverter is in KEYPAD operation mode.	
	(STP)	Inverter stopping	Outputs ON signal when the inverter is stopping mode or in DC braking mode.	
	(RDY)	Ready output	Outputs ON signal when the inverter is ready for operation.	
	(SW88)	Line/Inv changeover (for 88)	Outputs 88's ON signal for Line/Inverter changeover operation.	
	(SW52-2)	Line/Inv changeover (for 52-2)	Outputs 52-2's ON signal for Line/Inverter changeover operation.	
	(SW52-1)	Line/Inv changeover (for 52-1)	Outputs 52-1's ON signal for Line/Inverter changeover operation.	
	(SWM2)	Motor2/Motor1	Outputs the motor changeover switch ON signal from motor 1 to motor 2.	
	(AX)	Auxiliary terminal (for 52-1)	Used for auxiliary circuit of 52-1. (Same function as AX1, AX2 terminal by FRENIC5000G9S series. (30kW or larger))	Reffer to wiring diagram example.
	(TU)	Time-up signal	Outputs time up signal (100ms ON pulse) at every stage end of PATTERN operation.	
	(TO)	Cycle completion signal	Outputs one cycle completion signal (100ms ON pulse) at PATTERN operation.	
	(STG1) (STG2) (STG4)	Stage No indication 1 Stage No indication 2 Stage No indication 4	Outputs PATTERN operation's stage No. by signals STG1, STG2 and STG4.	
	(AL1) (AL2) (AL4) (AL8)	Alarm indication 1 Alarm indication 2 Alarm indication 4 Alarm indication 8	Outputs trip alarm No. by signals AL1, AL2, AL4, and AL8.	
	(FAN)	Fan operation signal	Outputs the inverter cooling fan operation status signal.	
	(TRY)	Auto-resetting	Outputs ON signal at auto resetting mode. (Including "Reset interval")	
	(U-DO)	Universal DO	Outputs command signal from main controller of LINK operation.	
	(OH)	Overheat early warning	Outputs ON signal when the heat sink temperature is higher than (trip level – 10°C), and outputs OFF signal when the temperature is lower than (trip level – 15°C).	
	(SY)	Synchronization completion signal	Synchronization completion signal for synchronized operation.	Option
	(LIFE)	Lifetime alarm	Outputs ON signal when the calculated lifetime is longer than preset alarm level.	
	(FDT2)	2nd Freq. level detection	2nd-outputs ON signal by comparison of output frequency and preset value (FDT2 level).	
	(OL2)	2nd OL level early warning	2nd-outputs ON signal when the output current value is larger than preset alarm level (OL2 level).	
	(C1OFF)	Terminal C1 off signal	Outputs ON signal when the C1 current is smaller than 2mA.	
	(DNZS)	Speed existance signal	Outputs ON signal at detection of motor speed when using OPC-G11S-PG/PG2/SY.	
	CME	Common (transistor output)	Common for transistor output signal.	Isolated from terminals CM and 11.
Relay output	30A, 30B, 30C	Alarm relay output	Outputs a contact signal when a protective function is activated. Changeable exciting mode active or non-exciting mode active by function "F36".	• Contact rating : 250V AC, 0.3A, cosø=0.3 48V DC, 0.5A, non-inductive
	Y5A, Y5C	Relay output	Functions can be selected the same as Y1 to Y4. Changeable exciting mode active or non-exciting mode active by function "E25".	
LINK	DXA, DXB, SD	RS-485 I/O terminal	Connect the RS-485 link signal.	

Basic Wiring Diagram

Keypad panel Operation

The following diagram is for reference only. For detailed wiring diagrams, refer to the relevant instruction manual.



NOTE:
Common terminals [11], (CM), and <CME> for control circuits are isolated from one another.

*1) Use the inverter whose rated input voltage matches the power supply voltage.
*2) Use this peripheral device when necessary.
*3) 55kW or smaller:
Terminals [P1] and [P(+)] are connected with a jumper wire before shipping. When connecting an optional DC reactor (DCR)*6), remove the jumper wire that connects the terminals [P1] and [P(+)].
75kW or larger:
Terminals [P1] and [P(+)] are not connected at shipment from factory. Be sure to connect the DC reactor (DCR) *6) standard provided to these terminals.
*4) For G11S models from 0.2 to 7.5kW, a built-in braking resistor (DBR) is connected to the inverter before shipping. (DBR is not mounted on G11S models 11kW or larger, and P11S models.)
*5) Terminals [R0] and [T0] are provided for G11S models 1.5kW or larger, and P11S models. These terminals are not provided for G11S models 0.75kW or smaller. Even if these terminals are not powered, the inverter can be operated.

(※)

Input voltage	CNUX connector
400 to 440V/50Hz, 440 to 480V/60Hz	U1 (Factory setting)
380V/50Hz (398V or smaller), 380 to 415V/60Hz (430V or smaller)	U2

Terminal Arrangement

• Main circuit terminals

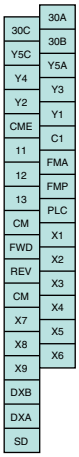
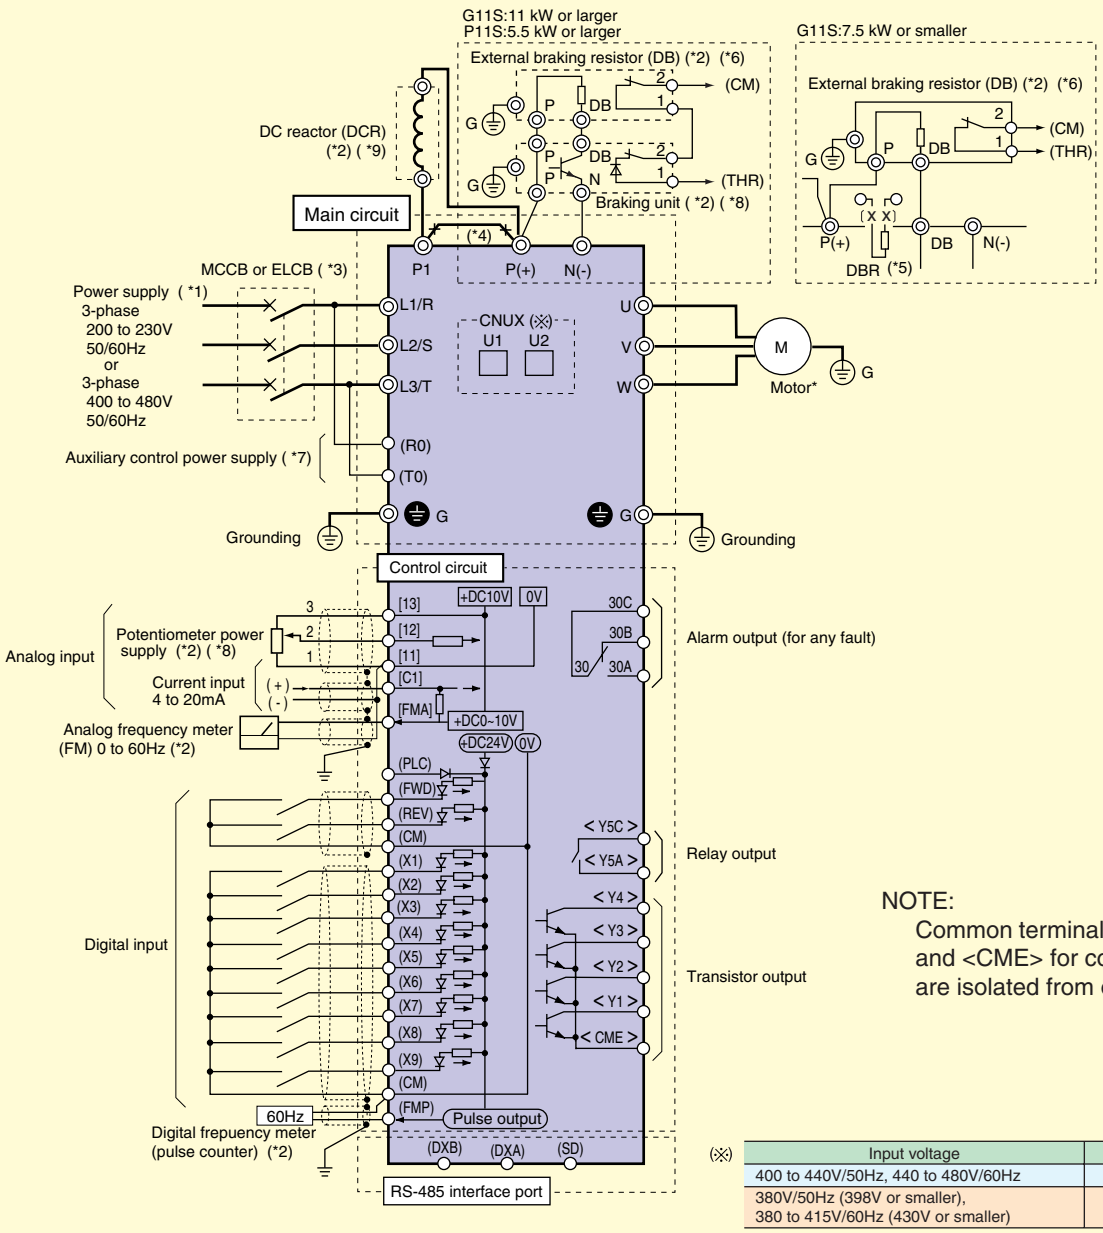
• Control circuit terminals



External signal input Operation

The following diagram is for reference only. For detailed wiring diagrams, refer to the relevant instruction manual.



NOTE:
Common terminals [11], (CM), and <CME> for control circuits are isolated from one another.

(※)

Input voltage	CNUX connector
400 to 440V/50Hz, 440 to 480V/60Hz	U1
380V/50Hz (398V or smaller), 380 to 415V/60Hz (430V or smaller)	U2 (Factory setting)

*Option

*1) Use the inverter whose rated input voltage matches the power supply voltage.
*2) An optional device. Use it when necessary.
*3) Use this peripheral device when necessary.
*4) 55kW or smaller:
Terminals [P1] and [P(+)] are connected with a jumper wire before shipping. When connecting an optional DC reactor (DCR) *9), remove the jumper wire that connects the terminals [P1] and [P(+)].
75kW or larger:
Terminals [P1] and [P(+)] are not connected at shipment from factory. Be sure to connect the DC reactor (DCR) *9) standard provided to these terminals.
*5) For G11S models from 0.2 to 7.5kW, a built-in braking resistor (DBR) is connected to the inverter before shipping. (DBR is not mounted on G11S models 11kW or larger, and P11S models.) When connecting an optional external braking resistor (DB), remove the DBR connection cables from [P(+)] and [DB] terminals. The end of the removed cables (indicated with an X) must be insulated.
*6) When connecting an optional external braking resistor (DB), be sure to also use an optional braking unit *8). Connect the optional braking unit to the [P(+)] and [N(-)] terminals. Auxiliary terminals [1] and [2] have polarity.
Be sure to connect cables to these terminals correctly. (See the diagram)
*7) Terminals [R0] and [T0] are provided for G11S models 1.5kW or larger, and P11S models. These terminals are not provided for G11S models 0.75kW or smaller. Even if these terminals are not powered, the inverter can be operated.

Keypad panel

LED monitor
In operation mode:
Displays the setting frequency, output current, voltage, motor speed, or line speed.
In trip mode:
Displays code indicating the cause of trip.

LCD monitor
In operation mode :
Displays various items of information such as operation condition and function data.
Operation guidance, which can be scrolled, is displayed at the bottom.
In program mode :
Displays functions and data.

Up/Down keys
In operation mode :
Increases or decreases the frequency or speed.
In program mode :
Increases or decreases function code number and data set value.

Unit indication
Displays the unit for the information shown on the LED monitor.

FWD/REV keys
In operation mode :
Starts the inverter with forward or reverse operation command.
Pressing the FWD or REV key lights the RUN lamp.
Invalid when the function code F02 (Operation method) is set at 1 (External signal operation).

Program key
Switches the display to a menu screen or to the initial screen for operation mode or alarm mode.

Shift key (Column shift)
In program mode :
Moves the cursor horizontally at data change. Pressing this key with the UP or DOWN key, the screen changes to the next function block.

Stop key
In operation mode :
Stops the inverter.
Invalid when the function code F02 (Operation method) is set at 1 (External signal operation).

Reset key
In program mode :
Cancels the current input data and shifts the screen.
In trip mode :
Releases the trip-stop state.

Function/Data Select key
In operation mode :
Changes the displayed values of LED monitor.
In program mode :
Selects the function code or stores the data.

Keypad panel operation

Perform the wiring shown in the Basic wiring diagram on page 14. Turn on inverter power, and use the ▲ or ▼ key to set an output frequency. Press the FUNC/DATA key, then press the FWD or REV key.
The inverter starts running using the factory setting function data.
Press the STOP key to stop the inverter.

Procedure for selecting function codes and data codes

The following is a sample procedure for selecting a function code and changing the function data.

① Press the PRG key to switch the operation monitor screen to the program menu screen.

```
RUN                    FWD
PRG → PRG    MENU
F/D  → LED   SHIFT
```

② Select "1. DATA SET", and press the FUNC/DATA key.

```
→ 1. DATA SET
  2. DATA CHECK
  3. OPR MNTR
  4. I / O CHECK
```

③ Press the ▲ or ▼ key to select a target function code. To quickly scroll the function select screen, press SHIFT key and the ▲ or ▼ key at the same time. At the target function, press FUNC/DATA key.

```
F00  DATA PRTC
F01  FREQ CMD 1
F02  OPR METHOD
F03  MAX Hz-1
```

④ Use the ▲, ▼, and SHIFT keys to change the function data to the target value. (Use the SHIFT key to move the cursor when you want to enter a numerical value.)

```
F01  FREQ CMD 1

                0
0~11
```

⑤ Press the FUNC/DATA key to store the updated function data in memory.
The screen shifts for the selection of the next function.

```
F02  OPR METHOD
F03  MAX Hz-1
F04  BASE Hz-1
F05  RATED V-1
```

⑥ Pressing the PRG key switches the screen to the operation monitor screen.

```
RUN                    FWD
PRG → PRG    MENU
F/D  → LED   SHIFT
```

1) **Setting a frequency**

When the operation monitor screen is displayed, a frequency can be set by using the ▲ or ▼ key in both the operation and stop modes. When the target frequency is displayed, press the FUNC/DATA key to enter the frequency in memory.

2) **Switching a unit indication**

During both operation and stop modes, each time the FUNC/DATA key is pressed, the value displayed on the LED monitor changes, and the unit indication on the LCD monitor shifts from Hz to A, V, r/min, m/min, kW, and % in this order in accordance with the displayed value.

Function settings

The functions in the yellow boxes can be set while the inverter is running. Other functions must be set while the inverter is stopped.

Fundamental Functions

	Function			Setting range	Min. unit	Factory setting	
	Code	Name	LCD monitor			–22kW	30kW–
Basic Functions	F00	Data protection	F00 DATA PRTC	0 : Data change enable 1 : Data protection	-	0	
	F01	Frequency command 1	F01 FREQ CMD 1	0 : KEYPAD operation (or key) 1 : Voltage input (terminals 12) (0 to +10V DC, 0 to +5V DC) 2 : Current input (terminal C1) (4 to 20mA DC) 3 : Voltage and current input (terminals 12 and C1) 4 : Reversible operation with polarity (terminal 12)(0 to ±10V DC) 5 : Reversible operation with polarity (terminals 12 and V1) (0 to ±10V DC) 6 : Inverse mode operation (terminals 12) (+10 to 0V DC) 7 : Inverse mode operation (terminal C1) (20 to 4mA DC) 8 : UP/DOWN control 1 (initial freq. = 0Hz) 9 : UP/DOWN control 2 (initial freq. = last value) 10 : PATTERN operation 11 : DI option or Pulse train input	-	0	
	F02	Operation method	F02 OPR METHOD	0 : KEYPAD operation (or or key) 1 : FWD or REV command signal operation	-	0	
	F03	Maximum frequency 1	F03 MAX Hz-1	G11S : 50 to 400Hz P11S : 50 to 120Hz	1Hz	60	
	F04	Base frequency 1	F04 BASE Hz-1	G11S : 25 to 400Hz P11S : 25 to 120Hz	1Hz	60	
	F05	Rated voltage 1 (at Base frequency 1)	F05 RATED V-1	0(Free), 320 to 480V (400V class) 0(Free), 80 to 240V (200V class)	1V	380 220	
	F06	Maximum voltage 1 (at Maximum frequency 1)	F06 MAX V-1	320 to 480V (400V class) 80 to 240V (200V class)	1V	380 220	
	F07	Acceleration time 1	F07 ACC TIME1	0.01 to 3600s	0.01s	6.00	20.00
	F08	Deceleration time 1	F08 DEC TIME1	0.01 to 3600s	0.01s	6.00	20.00
	F09	Torque boost 1	F09 TRQ BOOST1	0.0 : Automatic (for constant torque load) 0.1 to 1.9 : Manual (for variable torque load) 2.0 to 20.0 : Manual (for constant torque load)	0.1	G11S : 0.0 P11S : 0.1	
	F10	Electronic thermal overload protection for motor 1 (Select)	F10 ELCTRN OL1	0 : Inactive 1 : Active (for 4-pole standard motor) 2 : Active (for 4-pole inverter motor)	-	1	
	F11	(Level)	F11 OL LEVEL1	Approx. 20 to 135% of rated current	0.01A	*1)	
	F12	(Thermal time constant)	F12 TIME CNST 1	0.5 to 75.0 min	0.1min	5.0	10.0
	F13	Electronic thermal overload protection (for braking resistor)	F13 DBR OL	G11S [7.5kW or smaller] 0 : Inactive 1 : Active (built-in braking resistor) 2 : Active (DB***-2C / 4C external braking resistor)	-	1	
				[11kW or larger] 0 : Inactive	-	0	
				P11S [11kW or smaller] 0,1 : Inactive 2 : Active (DB***-2C / 4C external braking resistor)	-	0	
				[15kW or larger] 0 : Inactive	-	0	
	F14	Restart mode after momentary power failure (operation selection)	F14 RESTART	0 : Inactive (Trip and alarm when power failure occurs.) 1 : Inactive (Trip, and alarm when power recovers.) 2 : Inactive (Deceleration stop, and alarm.) 3 : Active (Smooth recovery by continuous operation mode) 4 : Active (Momentarily stops and restarts at output frequency of before power failure) 5 : Active (Momentarily stops and restarts at starting frequency)	-	1	
	F15	Frequency (High)	F15 H LIMITER	G11S : 0 to 400Hz P11S : 0 to 120Hz	1Hz	70

Function	Description			LED monitor
Overcurrent protection (Short-circuit) (Ground fault)	• Stops running to protect inverter from an overcurrent resulting from overload. • Stops running to protect inverter from an overcurrent due to a short-circuit in the output circuit. • Stops running to protect inverter from an overcurrent due to a ground fault in the output circuit. • Stops running to protect inverter from an overcurrent resulting from ground fault in the output circuit by detecting zero-phase current.	• 30kW or larger model only	During acceleration	OC1
			During deceleration	OC2
			While running at constant speed	OC3
			Groung fault	EF
Overvoltage protection	• The inverter stops when it detects an overvoltage in the DC link circuit.	• 400V series : 800V DC or more 200V series : 400V DC or more • Protection is not assured if excess AC line voltage is applied inadvertently.	During acceleration	OU1
			During deceleration	OU2
			While running at constant speed	OU3
Incoming surge protection	• Protects the inverter against surge voltage between the main circuit power line and ground. • Protects the inverter against surge voltage in the main circuit power line.	• The inverter may be tripped by some other protective function.		
Undervoltage protection	• Stops the inverter when the DC link circuit voltage drops below undervoltage level.	• 400V series : 360V DC (22kW or smaller), 375V DC (30kW or larger) • 200V series : 180V DC (22kW or smaller), 186V DC (30kW or larger)		LU
Input phase loss protection	• The inverter is protected from being damaged when open-phase fault occurs.			Lin
Overheat protection	• Stops the inverter when it detects excess heat sink temperature in case of cooling fan failure or overload. This is also caused by short-circuit of terminals 13 and 11.			OH1
	• Stops the inverter when it detects an abnormal rise in temperature in the inverter unit caused by insufficient ventilation in cubicles or an abnormal ambient temperature. • This is also caused by short-circuit of terminals 13 and 11 (overcurrent of 20mA at terminal 13).			OH3
	• When the built-in braking resistor overheats, the inverter stops discharging and running. • Function data appropriate for the resistor type (built-in/external) must be set.	• G11S : 7.5kW or smaller model only		dbH
Electronic thermal overload protection (Motor protection)	• This function stops the inverter by detecting an inverter overload.			OLU
	• This function stops the inverter by detecting an overload in a standard motor or inverter motor.		Motor 1 overload	OL1
			Motor 2 overload	OL2
Fuse blown	• When a blown fuse is detected, the inverter stops running.	• 30kW or larger model only		FUS
Stall prevention (Momentary overcurrent limitation)	• When an output current exceeds the limit during acceleration, this function lowers output frequency to prevent the occurrence of an OC1 trip.	• The stall prevention function can be disabled.		
Output phase loss error	• If an unbalance of output circuits is detected during auto-tuning, this function issues an alarm (and stops the inverter).			Er7
Active drive	• During running in which acceleration is 60s or longer, this function increases the acceleration time to prevent the occurrence of an OLU trip.	• The acceleration time can be prolonged up to three times the preset time.		
External alarm input	• The inverter stops on receiving external alarm signals. • This function is activated when the motor temperature rises where PTC thermistor is used for motor protection (H26: 1).	• Use THR terminal function (digital input).		OH2
Overspeed protection	• Stops the inverter when the output frequency exceeds the rated maximum frequency by 20%.			OS
PG error	• If disconnection occurs in pulse generator circuits, the inverter issues an alarm.			PG
Alarm output (for any fault)	• The inverter outputs a relay contact signal when the inverter issued an alarm and stopped.	• Output terminals: 30A, 30B, and 30C • Use the RST terminal function for signal input. • Even if main power input is turned off, alarm history and trip-cause data are retained.		
Alarm reset command	• An alarm-stop state of the inverter can be cleared with the RESET key or by a digital input signal (RST).			
Alarm history memory	• Store up to four instances of previous alarm data.			
Storage of data on cause of trip	• The inverter can store and display details of the latest alarm history data.			
Memory error	• The inverter checks memory data after power-on and when the data is written. If a memory error is detected, the inverter stops.			Er1
KEYPAD panel communication error	• If an error is detected in communication between the inverter and KEYPAD when the Keypad panel is being used, the inverter stops.	• When operated by external signals, the inverter continues running. The alarm output (for any fault) is not output. Only Er2 is displayed.		Er2
CPU error	• If the inverter detects a CPU error caused by noise or some other factor, the inverter stops.			Er3
Option communication error	• If a checksum error or disconnection is detected during communication, the inverter issues an alarm.			Er4
Option error	• If a linkage error or other option error is detected, the inverter issues an alarm.			Er5
Operation procedure error	• Er6 is indicated only when the inverter is forcedly stopped by [STOP 1] or [STOP 2] operation in E01to E09 (Set value: 30 or 31).			Er6
Output wiring error	• This error is detected when the wiring on the inverter output is disconnected unwired on auto-tuning.			Er7
Charging circuit alarm	• This alarm is activated when the power supply is not applied to the main terminal L1/R or L3/T or charging-circuit relay is faulty.	• 30kW or larger model only		Er7.
RS-485 communication error	• If an RS-485 communication error is detected, the inverter issues an alarm.			Er8

NOTES :
1)Retaining alarm signal when auxiliary controll power supply is not used :
If the inverter power supply is cut off while an internal alarm signal is being output, the alarm signal cannot be retained.
2)To issue the RESET command, press the [RESET] key on the KEYPAD panel or connect terminals RST and CM and disconnect them afterwards.
3)Fault history data is stored for the past four trips.

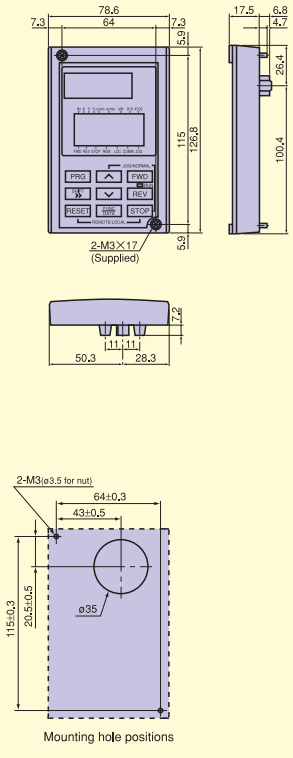
KEYPAD panel
(Common for all models)



Mounting hole positions

NOTE :
For 75kW or larger models, DC reactor is provided as standard (separately installed). For the outline dimensions, see page 27.

Reactor, Filter, and Other Accessories

Name (Type)	Function	Mounting position
Arrester (CN23232) (CN2324E)	Suppresses induced lightning surges from power source , thus protecting all equipment connected the power source.	
Radio noise reducing zero-phase reactor (ACL-40B) (ACL-74B)	Reduces radio frequency noise. If the wiring between motor and inverter is shorter than 20m, use the ferrite ring in the power supply side. If longer than 20m, use it in the output side.	
Power filter (FHF-TA/□□/250) (FHF-TA/□□/500) (FHF-TB/□□/250) (FHF-TB/□□/500)	Prevents the noise generated from the inverter. Supresses radiation noise and induction noise generated from the output side wiring.	
EMC compliant filter (EFL-□□□SP-2) (EFL-□□□G11-4) (RF3□□□-F11)	This is a special filter which complies with the European EMC (Emission) Directive. This filter should be used together with a ferrite core. *Note: Other prerequisites must be fulfilled to ensure compliance with EMC Directives. Refer to this filters operation manual for details.*	
Output circuit filter (OFL-□□□-□) (OFL-□□□-4A)	Connected to the output circuit of inverters under low-noise operation with carrier frequency from 8 to 15kHz, 6kHz or higher for 30kW or larger inverters (OFL-□□□-□), 0.75 to 15kHz, 0.75 to 10kHz for 75kW or larger inverters (OFL-□□□-4A). This filter has the following functions: ① Suppressing fluctuation of motor terminal voltage. Protects the motor insulation from being damaged by surge voltage. (400V series) ② Suppressing leakage current from output side wiring. (OFL-□□□-□ only) Reduces the leakage current caused when several motors are operated in parallel or connected with long wiring. * Total wiring length should be less than 400m. ③ Suppressing radial noise or inductive noise from output side wiring. Effective noise suppression device for long wiring applications such as plant. *Note: When connecting* OFL-□□□-□*, be sure to set the carrier frequency F26 at 8kHz or over.*	
DC REACTOR(DCR) (DCR4-□□□) (DCR2-□□□)	[Use the DCR to normalize the power supply in the following cases.] ① The power transformer capacity is 500kVA or over and exceeds the inverter rated capacity by 10 times. ② The inverter and a thyristor converter are connected with the same transformer. * Check if the thyristor converter uses a commutation reactor. If not, AC reactor must be connected to the power supply side. ③ Overvoltage trip occurs due to open/close of the phase-advancing capacitor for the power supply lines. ④ The voltage unbalance exceeds 2%. $\text{Voltage unbalance (\%)} = \frac{\text{Max. voltage [V]} - \text{Min. Voltage [V]}}{\text{Three-phase average voltage [V]}} \times 67$  [For improving input power-factor, reducing harmonics] • Used to reduce input harmonic current (correcting power-factor) • For the resultant effects, refer to the appended guidelines.	
Surge absorber (Surge suppressor) (S2-A-0) (S1-B-0)	S2-A-0: for magnetic contactor S1-B-0: for mini control relay, or timer	
Frequency meter (TRM-45) (FM-60)	Analog frequency meter TRM-45: 45mm square FM-60 : 60mm square	
Frequency setting device (RJ-13) (WA3W-1kΩ)	Frequency setting potentiometer (mounted externally)

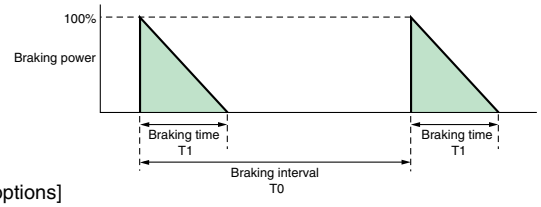
NOTES:
1) Each model of the P11S series uses options that are one-class smaller than the options for the G11S series of the same capacity.
2) The braking time and duty cycle (%) are calculated as the rated-torque braking used for deceleration.



• Duty cycle (%) = $\frac{T1}{T0} \times 100$ [%]

[Procedure for selecting options]
All three conditions listed below must be satisfied.
① The maximum braking torque does not exceed the value shown in the table.
② The energy discjarged in the resistor for each braking (the area of the triangle shown in the above figure) does not exceed the discharging capability (kWs) in the table.
③ The average loss (energy discharged in the resistor divided by a braking interval) does not exceed the average loss (kW) shown in the table.

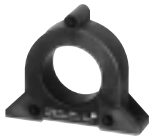
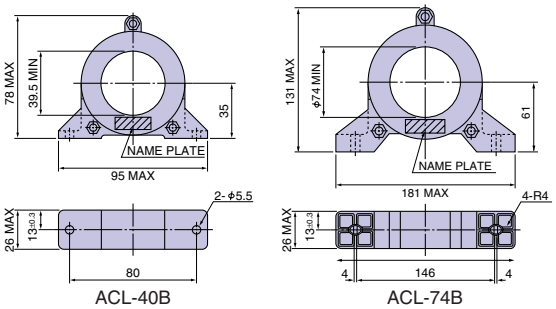
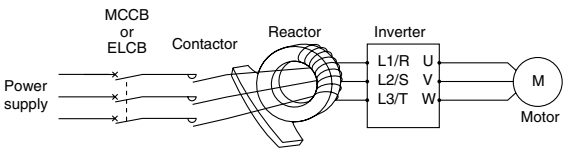
Radio noise reducing zero-phase reactor (ACL-40B)(ACL-74B)







Recommended wire size

Reactor type	Q'ty	No. of turns	Recommended wire size [mm²]
ACL-40B	1	4	2.0, 3.5, 5.5
	2	2	8, 14
ACL-74B	1	4	8, 14
	2	2	22, 38, 60, 5.5 × 2, 8 × 2, 14 × 2, 22 × 2
	4	1	100, 150, 200, 250, 325, 38 × 2, 60 × 2, 100 × 2, 150 × 2

Option cards and other options

<table>
<tr><th>Name (type)</th><th>Function</th><th>Specifications</th></tr>
<tr><td>Relay output card
(OPC-G11S-RY)</td><td>• Includes four relay output circuits.
• Converts transistor output signals from inverter control output terminals Y1 to Y4 to relay (SPDT) output signals.</td><td></td></tr>
<tr><td>Digital I/O interface card
(OPC-G11S-DIO)</td><td>• For setting frequency using a binary code.
• For monitoring frequency, output current, and output voltage using a binary code.
• For input and output of other individual signals.</td><td></td></tr>
<tr><td>Analog I/O interface card
(OPC-G11S-AIO)</td><td>• For setting a torque limit value using an input analog signal.
• For input of auxiliary signal to set frequency.
• For analog monitoring of inverter output frequency, output current, and torque.</td><td></td></tr>
<tr><td>T-link interface card
(OPC-G11S-TL)</td><td>• For setting a frequency.
• For setting, reading, and storing function data for function codes.
• For setting operation commands (FWD, REV, RST, etc.).
• For monitoring the operation status.
• For reading trip information.</td><td>• Used together with MICREX-F series PLC.</td></tr>
<tr><td>Open bus card</td><td>It is an optional card conforming to various open buses. The following operation can be made from the personal computer and PLC.
• Setting of running frequency
• Setting of operation command (FWD,REV,RST,etc.)
• Setting/reading of data code of each function code
• Monitoring running frequency and operation status</td><td><table><tr><th>Correspondent bus</th><th>Option type</th></tr><tr><td>PROFIBUS-DP</td><td>OPC-G11S-PDP</td></tr><tr><td>DeviceNet</td><td>OPC-G11S-DEV</td></tr><tr><td>Modbus Plus</td><td>OPC-G11S-MBP</td></tr><tr><td>Interbus-S</td><td>OPC-G11S-IBS</td></tr><tr><td>CAN open</td><td>OPC-G11S-COP</td></tr></table></td></tr>
<tr><td>RS-232C communication adaptor
(OPC-G11S-PC)</td><td>The RS-232C communication can be done by connecting it to the keypad panel on the main body of the inverter.</td><td></td></tr>
<tr><td>Personal computer loader</td><td>• The operation status monitoring and the parameter setting can be made through the inverter's RS-485 interface from the host personal computer.
• The parameter can be read and written collectively or individually.
• Comparison of two arbitrary parameters.
• Monitor of output frequency, output current, and operation status of inverter.
• Monitor of alarm history and operation information on alarm.</td><td>Communication
• Physical level : EIA-RS-485
• The number of units connected
: Maximum 31 inverters
• Synchronous method
: start-stop synchronization
• Transmission method : half duplex</td></tr>
<tr><td>PG feedback card
(OPC-G11S-PG)</td><td>• For performing PG vector control using feedback signals obtained from a PG.</td><td>Applicable Pulse Encoder specification:
• 100 to 3000P/R • A, B, Z phase • 12V or 15V</td></tr>
<tr><td>PG feedback card
(OPC-G11S-PG2)</td><td>• For performing PG vector control using feedback signals obtained from a PG.</td><td>Applicable Pulse Encoder specification:
• 100 to 3000P/R • A, B, Z phase • 5V</td></tr>

NOTES :
- For molded-case circuit breakers (MCCB) and earth-leakage circuit breakers (ELCB), the required frame type and series depend on the facility transformer capacity and other factors. When selecting optimal breakers, refer to the relevant technical data.
- Also select the rated sensitive current of ELCB utilizing the technical data.
- The recommended wire sizes are based on the condition that the temperature inside the panel does not exceeds 50°C.
- The above wires are 600V HIV insulated cables (75°C).
- Data in the above table may differ for different conditions (ambient temperature, power supply voltage, and other factors).

An Extensive Lineup Keeps The Fuji Inverter Family Actively Ahead

Application	Series (Cat. No.)	Features
For general industrial machines	**Compact inverter** FRENIC-Mini (MEH441)	● Easy to operate as frequency setting POT is provided as standard. ● Equipped with supreme automatic torque boost, current limiting function and slip compensation function for traverse carriers. ● Equipped with supreme automatic energy-saving operation function and PID control function for fans & pumps.
	Inverter for fans & pumps FRENIC-Eco (MEH442)	● Specially developed for variable torque loads such as fans & pumps. ● Equipped with a newly systemized automatic energy-saving, PID control, lifetime alarm and line/inverter operation changeover sequence functions, etc. ● Perfect for air conditioners, fans & pumps that were previously difficult to consider for use with an general-purpose inverter because of costs and functions.
	High-performance, compact inverter NEW FRENIC-Multi (MEH652 for JE) (MEH653 for EN)	● Designed for prolonged use (10 years) and complied with RoHS Directive to enhance its friendliness toward the environment. (Production lot of autumn 2005 or later) ● Handles all applications due to an extended capacity range, ample variations in product types and excellent maintainability. ● Provided with the functions of contact-stoppage operation, brake signal, torque limiting. and current limiting that are essential for traverse and transfer carriers.
	High-performance, multi-function inverter FRENIC5000G11S (MEH403 for JE) (MEH413 for EN)	● Achieved starting torque of 200% at 0.5Hz, with our unique dynamic torque vector control system. ● Fully replete with useful functions like auto tuning. ● A wide variation from 0.2 to 630kW (compact and enclosed type for 22kW or smaller).
	Inverter for fans & pumps FRENIC5000P11S (MEH403)	● Appropriate for equipment such as fans & pumps. ● Provides effortless energy-saving operation because of its automatic energy-saving function. ● Easy operation as interactive keypad is provided as standard.
	High-performance, vector control inverter FRENIC 5000VG7S (MEH405)	● A highly accurate inverter that quickly provides control responses and has stable torque characteristics. ● Can be used in a wide range of general industry systems as its extensive functions and a variety of options. ● Vector control operation of general-purpose motors thanks to the auto tuning function.
For machine tools	**Spindle drive system for machine tools** FRENIC 5000MS5 (MEH391)	● The converter separation structure enabling the configuration of multiaxial systems. ● Free combinations such as torque vector/high-performance vector control or dynamic braking/power regeneration. ● Supports multiple processing of machine tools due to extensive option functions.

Warranty

To all our customers who purchase Fuji Electric FA Components & Systems' products:

Please take the following items into consideration when placing your order.

When requesting an estimate and placing your orders for the products included in these materials, please be aware that any items such as specifications which are not specifically mentioned in the contract, catalog, specifications or other materials will be as mentioned below.
In addition, the products included in these materials are limited in the use they are put to and the place where they can be used, etc., and may require periodic inspection. Please confirm these points with your sales representative or directly with this company.
Furthermore, regarding purchased products and delivered products, we request that you take adequate consideration of the necessity of rapid receiving inspections and of product management and maintenance even before receiving your products.

1. Free of Charge Warranty Period and Warranty Range

1-1 Free of charge warranty period

(1) The product warranty period is "1 year from the date of purchase" or 18 months from the manufacturing date imprinted on the name place, whichever date is earlier.
(2) However, in cases where the use environment, conditions of use, use frequency and times used, etc., have an effect on product life, this warranty period may not apply.
(3) Furthermore, the warranty period for parts restored by Fuji Electric's Service Department is "6 months from the date that repairs are completed."

1-2 Warranty range

(1) In the event that breakdown occurs during the product's warranty period which is the responsibility of Fuji Electric, Fuji Electric will replace or repair the part of the product that has broken down free of charge at the place where the product was purchased or where it was delivered. However, if the following cases are applicable, the terms of this warranty may not apply.
  1) The breakdown was caused by inappropriate conditions, environment, handling or use methods, etc. which are not specified in the catalog, operation manual, specifications or other relevant documents.
  2) The breakdown was caused by the product other than the purchased or delivered Fuji's product.
  3) The breakdown was caused by the product other than Fuji's product, such as the customer's equipment or software design, etc.
  4) Concerning the Fuji's programmable products, the breakdown was caused by a program other than a program supplied by this company, or the results from using such a program.
  5) The breakdown was caused by modifications or repairs affected by a party other than Fuji Electric.
  6) The breakdown was caused by improper maintenance or replacement using consumables, etc. specified in the operation manual or catalog, etc.
  7) The breakdown was caused by a chemical or technical problem that was not foreseen when making practical application of the product at the time it was purchased or delivered.
  8) The product was not used in the manner the product was originally intended to be used.
  9) The breakdown was caused by a reason which is not this company's responsibility, such as lightning or other disaster.
(2) Furthermore, the warranty specified herein shall be limited to the purchased or delivered product alone.
(3) The upper limit for the warranty range shall be as specified in item (1) above and any damages (damage to or loss of machinery or equipment, or lost profits from the same, etc.) consequent to or resulting from breakdown of the purchased or delivered product shall be excluded from coverage by this warranty.

1-3. Trouble diagnosis

As a rule, the customer is requested to carry out a preliminary trouble diagnosis. However, at the customer's request, this company or its service network can perform the trouble diagnosis on a chargeable basis. In this case, the customer is asked to assume the burden for charges levied in accordance with this company's fee schedule.

2. Exclusion of Liability for Loss of Opportunity, etc.

Regardless of whether a breakdown occurs during or after the free of charge warranty period, this company shall not be liable for any loss of opportunity, loss of profits, or damages arising from special circumstances, secondary damages, accident compensation to another company, or damages to products other than this company's products, whether foreseen or not by this company, which this company is not be responsible for causing.

3. Repair Period after Production Stop, Spare Parts Supply Period (Holding Period)

Concerning models (products) which have gone out of production, this company will perform repairs for a period of 7 years after production stop, counting from the month and year when the production stop occurs. In addition, we will continue to supply the spare parts required for repairs for a period of 7 years, counting from the month and year when the production stop occurs. However, if it is estimated that the life cycle of certain electronic and other parts is short and it will be difficult to procure or produce those parts, there may be cases where it is difficult to provide repairs or supply spare parts even within this 7-year period. For details, please confirm at our company's business office or our service office.

4. Transfer Rights

In the case of standard products which do not include settings or adjustments in an application program, the products shall be transported to and transferred to the customer and this company shall not be responsible for local adjustments or trial operation.

5. Service Contents

The cost of purchased and delivered products does not include the cost of dispatching engineers or service costs. Depending on the request, these can be discussed separately.

6. Applicable Scope of Service

The above contents shall be assumed to apply to transactions and use of this company's products within the nation of Japan. Please discuss transactions and use outside Japan separately with the local supplier where you purchased the products, or with this company.

Memo

NOTES

In running general-purpose motors

• Driving a 400V general-purpose motor
When driving a 400V general-purpose motor with an inverter, damage to the insulation of the motor may occur. Use an output circuit filter (OFL) if necessary after checking with the motor manufacturer. Fuji's motors do not require the use of output circuit filters because of their reinforced insulation.

• Torque characteristics and temperature rise
When the inverter is used to run a general-purpose motor, the temperature of the motor becomes higher than when it is operated using a commercial power supply. In the low-speed range, the cooling effect will be weakened, so decrease the output torque of the motor. If constant torque is required in the low-speed range, use a Fuji inverter motor or a motor equipped with an externally powered ventilating fan.

• Vibration
Use of an inverter does not increase vibration of a general-purpose motor, but when the motor is mounted to a machine, resonance may be caused by the natural frequencies, including that of the machine system.
* The use of a rubber coupling or vibration dampening rubber is recommended.
* It is also recommended to use the inverter jump frequency control to avoid resonance points.
Note that operation of a 2-pole motor at 60Hz or more may cause abnormal vibration.

• Noise
When an inverter is used with a general-purpose motor, the motor noise level is higher than that with a commercial power supply. To reduce noise, raise carrier frequency of the inverter. High-speed operation at 60Hz or more can also result in more noise.

In running special motors

• Explosion-proof motors
When driving an explosion-proof motor with an inverter, use a combination of a motor and an inverter that has been approved in advance. Such approved products are available in our special product series. Contact Fuji Electric FA for details.

• Submersible motors and pumps
These motors have a larger rated current than general-purpose motors. Select an inverter whose rated output current is greater than that of the motor.
These motors differ from general-purpose motors in thermal characteristics. Set a low value in the thermal time constant of the motor when setting the electronic thermal facility.

• Brake motors
For motors equipped with parallel-connected brakes, their braking power must be supplied from the inverter input side (the primary circuit). If the brake power is connected to the inverter power output side (the secondary circuit) by mistake, problems may occur.
Do not use inverters for driving motors equipped with series-connected brakes.

• Geared motors
If the power transmission mechanism uses an oil-lubricated gearbox or speed changer/reducer, then continuous motor operation at low speed may cause poor lubrication. Avoid such operation.

• Synchronous motors
It is necessary to use software suitable for this motor type. Contact Fuji Electric FA for details.

• Single-phase motors
Single-phase motors are not suitable for inverter-driven variable speed operation. Use three-phase motors.
* Even if a single-phase power supply is available, use a three-phase motor as the inverter provides three-phase output.

Environmental conditions

• Installation location
Use the inverter in a location with an ambient temperature range of -10 to 50°C.
The inverter heat sinks and braking resistor surfaces become hot under certain operating conditions. Install the inverter on nonflammable material such as metal.
Ensure that the installation location meets the environmental conditions specified in "Environment" in Common specifications on page 11. For inverters of 22kW or smaller, remove the ventilation covers when operating it at a temperature of 40°C or higher.

Combination with peripheral devices

• Installing a molded case circuit breaker (MCCB) or earth leakage circuit breaker (ELCB)
Install a recommended molded case circuit breaker (MCCB) or an earth leakage circuit breaker (ELCB) (with the exception of those exclusively designed for protection from ground faults) in the primary circuit of the inverter to protect the wiring. Ensure that the circuit breaker capacity is equivalent to or lower than the recommended capacity.

• Installing a magnetic contactor (MC) on the inverter power output side (the secondary circuit)
If a magnetic contactor (MC) is mounted on the inverter power output side (the secondary circuit) for switching the motor to commercial power or for any other purpose, turn the MC on or off while both the inverter and the motor are fully stopped.
Remove the surge suppressor integrated with the MC.
For switching operation from/to commercial power supply, use of newly developed "Line/inverter changeover operation" function using terminals such as SW88, SW52-2, SW52-1, SW50, is recommended.

• Installing a magnetic contactor (MC) on the inverter input side (the primary circuit)
Do not turn the magnetic contactor (MC) on the inverter input side (the primary circuit) on or off more than once an hour as an inverter fault may result. If frequent starts or stops are required during motor operation, use FWD/REV signals.

• Protecting the motor
When driving a motor with an inverter, the electronic thermal facility of the inverter can protect the motor. The operation level and the motor type (general-purpose motor, inverter motor) should be set. For high-speed motors or water-cooled motors, set a small value for the thermal time constant to protect the motor, in combination with the "cooling system OFF" signal.
When driving several motors with an inverter, connect a thermal relay to each motor and turn on the inverter's electronic thermal relay facility.
If you connect the motor thermal relay to the motor with a long cable, a high-frequency current may flow into the wiring stray capacitance. This may cause the relay to trip at a current lower than the set value for the thermal relay. If this happens, lower the carrier frequency or use the output circuit filter (OFL).

• Discontinuance of power-factor correcting capacitor
Do not mount power-factor correcting capacitors in the inverter primary circuit. (Use the DC REACTOR to improve the inverter power-factor.) Do not use power-factor correcting capacitors in the inverter output circuit. An overcurrent trip will occur, disabling motor operation.

• Discontinuance of surge killer
Do not mount surge killers in the inverter secondary circuit.

• Reducing noise
Use of a filter and shielded wires are typical measures against noise to ensure that EMC Directives are met. Refer to Appendices, App. A "Advantageous Use of Inverters (Notes on electrical noise)" for details.

• Measures against surge currents
If an overvoltage trip occurs while the inverter is stopped or operated under a light load, it is assumed that the surge current is generated by open/close of the phase-advancing capacitor in the power system.
* Connect a DC REACTOR to the inverter.

• Megger test
When checking the insulation resistance of the inverter, use a 500V megger and follow the instructions contained in the FRN-G11S/P11S Instruction Manual.

Wiring

• Control circuit wiring length
When using remote control, limit the wiring length between the inverter and operator box to 20m or less and use twisted shielded cable.

• Wiring length between inverter and motor
If long wiring is used between the inverter and the motor, the inverter will overheat or trip as a result of overcurrent (high-frequency current flowing into the stray capacitance) in the wires connected to the phases. Ensure that the wiring is shorter than 50m for 3.7kW or less, and shorter than 100m for 5.5kW or more. If this length must be exceeded, lower the carrier frequency or mount an output circuit filter (OFL).
When wiring is longer than 50m, and Dynamic torque-vector control or vector with PG is selected, execute off-line auto-tuning.

• Wiring size
Select cables with a sufficient capacity by referring to the current value or recommended wire size.

• Wiring type
Do not use multicore cables.

• Grounding
Securely ground the inverter using the grounding terminal.

Selecting inverter capacity

• Driving general-purpose motor
Select an inverter according to the applicable motor ratings listed in the standard specifications table for the inverter. When high starting torque is required or quick acceleration or deceleration is required, select an inverter with a capacity one size greater than the standard.

• Driving special motors
Select an inverter that meets the following condition:
Inverter rated current > Motor rated current

Transportation and storage

When transporting or storing inverters or inverters while mounted on machines, follow the procedures and select locations that meet the environmental conditions listed in the FRN-G11S/P11S Instruction Manual.
